| Academic Year | 2017/18 |
| Faculty / School | 104 - Facultad de Medicina |
| Degree | 461 - Master's in Genetic, nutritional and environmental growth and development conditiioners |
| ECTS | 3.0 |
| Year | 1 |
| Semester | Annual |
| Subject Type | Compulsory |
| Module | --- |

1.General information**1.1.Introduction****1.2.Recommendations to take this course****1.3.Context and importance of this course in the degree****1.4.Activities and key dates****2.Learning goals****2.1.Learning goals****2.2.Importance of learning goals****3.Aims of the course and competences****3.1.Aims of the course****3.2.Competences****4.Assessment (1st and 2nd call)****4.1.Assessment tasks (description of tasks, marking system and assessment criteria)****5.Methodology, learning tasks, syllabus and resources****5.1.Methodological overview**

This course has no face-to-face sessions, it is done via the virtual platform Moodle. The course contents include original works and/or explanatory presentations.

Although the students have access to the materials on the platform, teachers will be available for queries and doubts via email, messages and chats. Before raising any issue/question it is essential to do a thorough and comprehensive reading

of the available contents.

5.2.Learning tasks

In order to acquire the competences related to this course, students should review autonomously the concepts and content posted on the virtual platform.

Subsequently, to acquire practical skills and the "know-how" competence, students will prepare a research project supervised by the teacher in which they will show the acquired skills and methodologies reviewed during the course. This project will consider, based on a hypothesis, the research methodology needed to develop its objectives, always related to the course contents. Project guideliness will be available on the virtual platform.

5.3.Syllabus

The course will address the following topics:

- Topic 1. Growth and development. Energy balance.
- Topic 2. Standards population anthropometric, body composition, growth and maturation.
- Topic 3. Types of nutritional studies and scientific methodology.
- Topic 4. Models, components and distribution of body composition.
- Topic 5. Physical anthropometry and their indexes.
- Topic 6. Bioelectrical impedance techniques.
- Topic 7. Methods for the analysis accuracy of body composition:
 - densitometric and plethysmographic techniques. BOD POD®;
 - Dual X-ray absorptiometry
- Topic 8. Quantification of energy expenditure in children and adolescents. Components and determinants.
- Topic 9. Dietary surveys and questionnaires on eating habits and physical activity.
- Topic 10. Development of a research project related to the exploration of nutritional status.

5.4.Course planning and calendar

This course takes place during the months of March-April of the academic year.

Submission dates of the project will be informed at the beginning of the course through a message / announcement of the teacher.
